WATER ON CAMPUS

Masha & Dasha, MIPT

Слайд 1 — Титульный

Маша: Good morning, everyone! First, let me introduce ourselves. My name is Masha, and this is my partner Dasha. We are students at MIPT, and today we would like to present our project — "Water on Campus".

Даша: We are going to talk about a problem that every single person in this room faces every day — and about a simple solution that can change it.

Слайд 2 — Проблема

Маша: I think everybody has heard about how important water is for our health. According to medical research, every person needs to drink about two litres of water a day. But let's be honest — how much water do you actually drink during a day at MIPT?

Даша: We carried out some research among our fellow students, and we saw evidence that the situation is really bad. There is not a single free water cooler on our campus. Students study from nine in the morning and can stay until nine in the evening. And nobody can carry two litres of water to every pair.

Маша: As a student, I have experienced this first hand. I realised that the lack of drinking water is a major problem at our university. It affects our health, our concentration and even our mood. But it doesn't have to be this way.

Слайд 3 — Решение

Даша: So, what is our solution? We decided to install free water coolers across the MIPT campus. These are devices that can provide clean, filtered drinking water at any time.

Маша: It will make free water available anywhere on campus — for example, on the second floor of the Main Building, on the first floor of the Laboratory Building, and in the Applied Mathematics Building. Students simply bring their own reusable bottles and fill them up whenever they need. It allows people to stay hydrated without spending money and without carrying heavy bottles from home.

Даша: The technology is based on a standard filtration system. It consists of a water filter, a cooling unit and a tap. The water is purified, so it is completely safe to drink. It can be used by hundreds of students every day.

Слайд 4 — Почему это важно

Маша: This project is different from simply buying bottled water in two ways. First, it is completely free for students. Second, it uses reusable bottles, as opposed to single-use plastic ones.

Даша: It allows students to drink more water, which means better concentration during lectures and better health. It also helps the environment — less plastic waste. So it is good for you and good for the planet.

Маша: The point I am trying to make is that access to water is not a luxury — it is vital for every MIPT student. And it can be solved easily.

Слайд 5 — Как мы это сделаем

Даша: You might ask — how can we make it happen? We developed a simple plan. First, we will contact the MIPT administration and find funding. Second, we will identify the best locations for the water stations. Third, the coolers will be installed. And finally, we will launch an information campaign so that everyone knows where to find the water.

Маша: We have already come up with a simple map of the campus and marked the most useful places for the first water stations. Based on this, we developed the final version of our plan.

Даша: We are also planning to make the project visible: signs, stickers and a short guide for students on how to use the coolers and keep them clean.

Слайд 6 — Будущие планы и заключение

Маша: Currently, more people are joining our project — MIPT students and teachers support the idea. Our goal is to install the first three pilot water stations this year. Hopefully, in a few years the system will be used across the whole university.

Даша: To sum up: our MIPT campus has no free drinking water, students need two litres a day, and our project offers a simple, free and eco-friendly solution. It is vital for our health and our success.

Маша: Thank you for listening! We are happy to answer your questions.
